

Live Dashboard — UI Mockups

Static rendering of each state. The real dashboard updates these views live via SSE as the backend confirms, cancels, and declines reservations.

STATE 1 · PRE-SALE (SEATS OPEN, NO RESERVATIONS YET)

What the dashboard looks like the moment the show is created and before anyone has reserved.

STATE 2 · MID-BURST (STAMPEDE IN PROGRESS, HOT-SEAT A12 UNDER STORM)

A ~500-user burst is running. Seat **A12** is the hot target — it just confirmed to one user and is now showing the pulse glow. Dozens of concurrent attempts for A12 are declining cleanly as 409 (visible in the feed).

STATE 3 · NEAR SOLD OUT (RECONCILIATION STILL HOLDING)

Burst is winding down. Only 3 seats remain available. Reconciliation badge is still green — the invariant `available + held + confirmed == total` has held through every state change.

STATE 4 · RECONNECTING (SSE DROPPED, GRID FROZEN AT LAST KNOWN STATE)

The SSE stream disconnected (e.g., Fly proxy hiccup). Badge turns amber. Grid shows last known state but is explicitly marked as frozen. EventSource is auto-retrying with exponential backoff — on reconnect we discard local state and wait for a fresh baseline event.

Rendering notes. Colors satisfy 4.5:1 contrast on fills. State is encoded by both color AND a text label (C for confirmed, H for held, blank for available) so colorblind viewers aren't excluded. The hot-seat glow is a 500ms pulse (via box-shadow) — the printed mockup shows one freeze-frame; in the live view it fades. If prefers-reduced-motion is set, the pulse becomes a static color swap.
